SQL - SYNTAX

All the sql statements start with any of the keywords like select, insert, update, delete, alter, drop, create, use, show and all the statements end with a semicolon (;).

Important point to be noted is that sql is case insensitive which means select and select have same meaning in sql statements but mysql make difference in table names. So if you are working with mysql then you need to give table names as they exist in the database.

SQL SELECT STATEMENT:

```
SELECT column1, column2....columnN  
FROM table_name;
```

SQL DISTINCT CLAUSE:

```
SELECT DISTINCT column1, column2....columnN  
FROM table_name;
```

SQL WHERE CLAUSE:

```
SELECT column1, column2....columnN  
FROM table_name  
WHERE CONDITION;
```

SQL AND/OR CLAUSE:

```
SELECT column1, column2....columnN  
FROM table_name  
WHERE CONDITION-1 {AND|OR} CONDITION-2;
```

SQL IN CLAUSE:

```
SELECT column1, column2....columnN  
FROM table_name  
WHERE column_name IN (val-1, val-2,...val-N);
```

SQL BETWEEN CLAUSE:

```
SELECT column1, column2....columnN  
FROM table_name  
WHERE column_name BETWEEN val-1 AND val-2;
```

SQL LIKE CLAUSE:

```
SELECT column1, column2....columnN  
FROM table_name  
WHERE column_name LIKE { PATTERN };
```

SQL ORDER BY CLAUSE:

```
SELECT column1, column2....columnN  
FROM   table_name  
WHERE  CONDITION  
ORDER BY column_name {ASC|DESC};
```

SQL GROUP BY CLAUSE:

```
SELECT SUM(column_name)  
FROM   table_name  
WHERE  CONDITION  
GROUP BY column_name;
```

SQL COUNT CLAUSE:

```
SELECT COUNT(column_name)  
FROM   table_name  
WHERE  CONDITION;
```

SQL CREATE TABLE STATEMENT:

```
CREATE TABLE table_name(  
column1 datatype,  
column2 datatype,  
column3 datatype,  
....  
columnN datatype,  
PRIMARY KEY( one or more columns )  
);
```

SQL DROP TABLE STATEMENT:

```
DROP TABLE table_name;
```

SQL CREATE INDEX STATEMENT :

```
CREATE UNIQUE INDEX index_name  
ON table_name ( column1, column2,...columnN );
```

SQL DROP INDEX STATEMENT :

```
ALTER TABLE table_name  
DROP INDEX index_name;
```

SQL DESC STATEMENT :

```
DESC table_name;
```

SQL TRUNCATE TABLE STATEMENT:

```
TRUNCATE TABLE table_name;
```

SQL ALTER TABLE STATEMENT:

```
ALTER TABLE table_name {ADD|DROP|MODIFY} column_name {data_type};
```

SQL ALTER TABLE STATEMENT (RENAME) :

```
ALTER TABLE table_name RENAME TO new_table_name;
```

SQL INSERT INTO STATEMENT:

```
INSERT INTO table_name( column1, column2....columnN)
VALUES ( value1, value2....valueN);
```

SQL UPDATE STATEMENT:

```
UPDATE table_name
SET column1 = value1, column2 = value2....columnN=valueN
[ WHERE CONDITION ];
```

SQL DELETE STATEMENT:

```
DELETE FROM table_name
WHERE {CONDITION};
```

SQL CREATE DATABASE STATEMENT:

```
CREATE DATABASE database_name;
```

SQL DROP DATABASE STATEMENT:

```
DROP DATABASE database_name;
```

SQL USE Statement:

```
USE DATABASE database_name;
```

SQL COMMIT STATEMENT:

```
COMMIT;
```

SQL ROLLBACK STATEMENT:

```
ROLLBACK;
```

SQL - DATA TYPES

SQL data type is an attribute that specifies type of data of any object. Each column, variable and expression has related data type in SQL.

You would use these data types while creating your tables. You would choose a particular data type for a table column based on your requirement.

SQL Server offers six categories of data types for your use:

EXACT NUMERIC DATA TYPES:

DATA TYPE	FROM	TO
Bigint	-9,223,372,036,854,775,808	9,223,372,036,854,775,807
Int	-2,147,483,648	2,147,483,647
Smallint	-32,768	32,767
Tinyint	0	255
Bit	0	1
Decimal	-10^38 +1	10^38 .1
Numeric	-10^38 +1	10^38 .1
Money	-922,337,203,685,477.5808	+922,337,203,685,477.5807
smallmoney	-214,748.3648	+214,748.3647

APPROXIMATE NUMERIC DATA TYPES:

DATA TYPE	FROM	TO
Float	-1.79E + 308	1.79E + 308
Real	-3.40E + 38	3.40E + 38

DATE AND TIME DATA TYPES:

DATA TYPE	FROM	TO
Datetime	Jan 1, 1753	Dec 31, 9999
smalldatetime	Jan 1, 1900	Jun 6, 2079
Date	Stores a date like June 30, 1991	
Time	Stores a time of day like 12:30 P.M.	

Note: Here datetime has 3.33 milliseconds accuracy where as smalldatetime has 1 minute accuracy.

CHARACTER STRINGS DATA TYPES:

DATA TYPE	FROM	TO
------------------	-------------	-----------

Char	char	Maximum length of 8,000 characters.(Fixed length non-Unicode characters)
Varchar	varchar	Maximum of 8,000 characters.(Variable-length non-Unicode data).
varchar(max)	varchar(max)	Maximum length of 231characters, Variable-length non-Unicode data (SQL Server 2005 only).
Text	text	Variable-length non-Unicode data with a maximum length of 2,147,483,647 characters.

UNICODE CHARACTER STRINGS DATA TYPES:

DATA TYPE	Description
Nchar	Maximum length of 4,000 characters.(Fixed length Unicode)
Nvarchar	Maximum length of 4,000 characters.(Variable length Unicode)
nvarchar(max)	Maximum length of 231characters (SQL Server 2005 only). (Variable length Unicode)
Ntext	Maximum length of 1,073,741,823 characters. (Variable length Unicode)

BINARY DATA TYPES:

DATA TYPE	Description
Binary	Maximum length of 8,000 bytes(Fixed-length binary data)
Varbinary	Maximum length of 8,000 bytes.(Variable length binary data)
varbinary(max)	Maximum length of 231 bytes (SQL Server 2005 only). (Variable length Binary data)
Image	Maximum length of 2,147,483,647 bytes. (Variable length Binary Data)

MISC DATA TYPES:

DATA TYPE	Description
sql_variant	Stores values of various SQL Server-supported data types, except text, ntext, and timestamp.
Timestamp	Stores a database-wide unique number that gets updated every time a row gets updated

uniqueidentifier	Stores a globally unique identifier (GUID)
Xml	Stores XML data. You can store xml instances in a column or a variable (SQL Server 2005 only).
Cursor	Reference to a cursor object

SQL - CREATE DATABASE

The SQL **CREATE DATABASE** statement is used to create new SQL database.

SYNTAX:

Basic syntax of CREATE DATABASE statement is as follows:

```
CREATE DATABASE DatabaseName;
```

Always database name should be unique within the RDBMS.

EXAMPLE:

If you want to create new database <testDB>, then CREATE DATABASE statement would be as follows:

```
SQL> CREATE DATABASE testDB;
```

Make sure you has admin previledge before creating any database. Once a database is created, you can check it in the list of databases as follows:

```
SQL> SHOW DATABASES;
+-----+
| Database      |
+-----+
| information_schema |
| AMROOD        |
| TUTORIALSPPOINT |
| mysql          |
| orig           |
| test           |
| testDB         |
+-----+
7 rows in set (0.00 sec)
```

DROP DATABASE

The SQL **DROP DATABASE** statement is used to drop any existing database in SQL schema.

SYNTAX:

Basic syntax of DROP DATABASE statement is as follows:

```
DROP DATABASE DatabaseName;
```

Always database name should be unique within the RDBMS.

EXAMPLE:

If you want to delete an existing database <testDB>, then DROP DATABASE statement would be as follows:

```
SQL> DROP DATABASE testDB;
```

NOTE: Be careful before using this operation because by deleting an existing database would result in loss of complete information stored in the database.

Make sure you has admin previledge before dropping any database. Once a database is dropped, you can check it in the list of databases as follows:

```
SQL> SHOW DATABASES;
+-----+
| Database      |
+-----+
| information_schema |
| AMROOD        |
| TUTORIALSPPOINT |
| mysql          |
| orig           |
| test           |
+-----+
6 rows in set (0.00 sec)
```

CREATE TABLE

Creating a basic table involves naming the table and defining its columns and each column's data type.

The SQL **CREATE TABLE** statement is used to create a new table.

SYNTAX:

Basic syntax of CREATE TABLE statement is as follows:

```
CREATE TABLE table_name(
    column1 datatype,
    column2 datatype,
    column3 datatype,
    ....
    columnN datatype,
    s   PRIMARY KEY( one or more columns )
);
```

CREATE TABLE is the keyword telling the database system what you want to do. In this case, you want to create a new table. The unique name or identifier for the table follows the **CREATE TABLE** statement.

Then in brackets comes the list defining each column in the table and what sort of data type it is. The syntax becomes clearer with an example below.

A copy of an existing table can be created using a combination of the **CREATE TABLE** statement and the **SELECT** statement. You can check complete detail at [Create Table Using another Tables](#)

EXAMPLE:

Following is an example which creates a **CUSTOMERS** table with **ID** as primary key and **NOT NULL** are the constraints showing that these fields can not be **NULL** while creating records in thisy table:

```
SQL> CREATE TABLE CUSTOMERS (
    ID      INT          NOT NULL,
    NAME   VARCHAR (20)  NOT NULL,
    AGE    INT          NOT NULL,
    ADDRESS CHAR (25) ,
    SALARY  DECIMAL (18, 2),
    PRIMARY KEY (ID)
);
```

You can verify if your table has been created successfully by looking at the message displayed by the SQL server otherwise you can use **DESC** command as follows:

```

SQL> DESC CUSTOMERS;
+-----+-----+-----+-----+-----+
| Field | Type      | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+
| ID    | int(11)   | NO  | PRI |          |       |
| NAME  | varchar(20)| NO  |      |          |       |
| AGE   | int(11)   | NO  |      |          |       |
| ADDRESS | char(25) | YES |      | NULL    |       |
| SALARY | decimal(18,2)| YES |      | NULL    |       |
+-----+-----+-----+-----+-----+
5 rows in set (0.00 sec)

```

Now you have CUSTOMERS table available in your database which you can use to store required information related to customers.

8 SQL - DISTINCT KEYWORD

EXAMPLE:

Consider CUSTOMERS table is having following records:

```

+-----+-----+-----+-----+
| ID | NAME      | AGE | ADDRESS     | SALARY |
+-----+-----+-----+-----+
| 1  | Ramesh    | 32  | Ahmedabad   | 2000.00 |
| 2  | Khilan    | 25  | Delhi        | 1500.00 |
| 3  | kaushik   | 23  | Kota         | 2000.00 |
| 4  | Chaitali  | 25  | Mumbai       | 6500.00 |
| 5  | Hardik    | 27  | Bhopal       | 8500.00 |
| 6  | Komal     | 22  | MP           | 4500.00 |
| 7  | Muffy     | 24  | Indore       | 10000.00 |
+-----+-----+-----+-----+

```

First let us see how the following SELECT query returns duplicate salary records:

```

SQL> SELECT SALARY FROM CUSTOMERS
      ORDER BY SALARY;

```

This would produce following result where salary 2000 is coming twice which is a duplicate record from the original table.

```

+-----+
| SALARY |
+-----+
| 1500.00 |
| 2000.00 |
| 2000.00 |
| 4500.00 |
| 6500.00 |
| 8500.00 |
| 10000.00 |
+-----+

```

Now let us use DISTINCT keyword with the above SELECT query and see the result:

```
SQL> SELECT DISTINCT SALARY FROM CUSTOMERS  
      ORDER BY SALARY;
```

This would produce following result where we do not have any duplicate entry:

```
+-----+  
| SALARY |  
+-----+  
| 1500.00 |  
| 2000.00 |  
| 4500.00 |  
| 6500.00 |  
| 8500.00 |  
| 10000.00 |  
+-----+
```

SQL - Group By

EXAMPLE:

Consider CUSTOMERS table is having following records:

```
+---+-----+---+-----+-----+  
| ID | NAME      | AGE | ADDRESS    | SALARY |  
+---+-----+---+-----+-----+  
| 1  | Ramesh     | 32 | Ahmedabad  | 2000.00 |  
| 2  | Khilan     | 25 | Delhi       | 1500.00 |  
| 3  | kaushik    | 23 | Kota        | 2000.00 |  
| 4  | Chaitali   | 25 | Mumbai      | 6500.00 |  
| 5  | Hardik     | 27 | Bhopal     | 8500.00 |  
| 6  | Komal      | 22 | MP          | 4500.00 |  
| 7  | Muffy      | 24 | Indore     | 10000.00 |  
+---+-----+---+-----+-----+
```

If you want to know the total amount of salary on each customer, then GROUP BY query would be as follows:

```
SQL> SELECT NAME, SUM(SALARY) FROM CUSTOMERS  
      GROUP BY NAME;
```

This would produce following result:

NAME	SUM(SALARY)
Chaitali	6500.00
Hardik	8500.00
kaushik	2000.00
Khilan	1500.00
Komal	4500.00
Muffy	10000.00
Ramesh	2000.00

Now let us has following table where CUSTOMERS table has following records with duplicate names:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Ramesh	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	kaushik	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Now again, if you want to know the total amount of salary on each customer, then GROUP BY query would be as follows:

```
SQL> SELECT NAME, SUM(SALARY) FROM CUSTOMERS  
      GROUP BY NAME;
```

This would produce following result:

NAME	SUM(SALARY)
Hardik	8500.00
kaushik	8500.00
Komal	4500.00
Muffy	10000.00
Ramesh	3500.00

SQL - ORDER BY Clause

EXAMPLE:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is an example which would sort the result in ascending order by NAME and SALARY:

```
SQL> SELECT * FROM CUSTOMERS  
      ORDER BY NAME, SALARY;
```

This would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
3	kaushik	23	Kota	2000.00
2	Khilan	25	Delhi	1500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00
1	Ramesh	32	Ahmedabad	2000.00

Following is an example which would sort the result in descending order by NAME:

```
SQL> SELECT * FROM CUSTOMERS  
      ORDER BY NAME DESC;
```

This would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
7	Muffy	24	Indore	10000.00
6	Komal	22	MP	4500.00
2	Khilan	25	Delhi	1500.00

```

| 3 | kaushik | 23 | Kota      | 2000.00 |
| 5 | Hardik  | 27 | Bhopal    | 8500.00 |
| 4 | Chaitali | 25 | Mumbai    | 6500.00 |
+---+-----+-----+-----+

```

SQL - SORTING Results

The SQL **ORDER BY** clause is used to sort the data in ascending or descending order, based on one or more columns. Some database sorts query results in ascending order by default.

Syntax:

The basic syntax of ORDER BY clause which would be used to sort result in ascending or descending order is as follows:

```

SELECT column-list
FROM table_name
[WHERE condition]
[ORDER BY column1, column2, .. columnN] [ASC | DESC];

```

You can use more than one column in the ORDER BY clause. Make sure whatever column you are using to sort, that column should be in column-list.

Example:

Consider CUSTOMERS table is having following records:

```

+---+-----+---+-----+-----+
| ID | NAME      | AGE | ADDRESS   | SALARY   |
+---+-----+---+-----+-----+
| 1  | Ramesh    | 32 | Ahmedabad | 2000.00 |
| 2  | Khilan    | 25 | Delhi     | 1500.00 |
| 3  | kaushik   | 23 | Kota      | 2000.00 |
| 4  | Chaitali  | 25 | Mumbai    | 6500.00 |
| 5  | Hardik    | 27 | Bhopal    | 8500.00 |
| 6  | Komal     | 22 | MP        | 4500.00 |
| 7  | Muffy     | 24 | Indore   | 10000.00 |
+---+-----+---+-----+-----+

```

Following is an example which would sort the result in ascending order by NAME and SALARY:

```

SQL> SELECT * FROM CUSTOMERS
      ORDER BY NAME, SALARY;

```

This would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
3	kaushik	23	Kota	2000.00
2	Khilan	25	Delhi	1500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00
1	Ramesh	32	Ahmedabad	2000.00

Following is an example which would sort the result in descending order by NAME:

```
SQL> SELECT * FROM CUSTOMERS
      ORDER BY NAME DESC;
```

This would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
7	Muffy	24	Indore	10000.00
6	Komal	22	MP	4500.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
5	Hardik	27	Bhopal	8500.00
4	Chaitali	25	Mumbai	6500.00

To fetch the rows with own preferred order, the SELECT query would as follows:

```
SQL> SELECT * FROM CUSTOMERS
      ORDER BY (CASE ADDRESS
                  WHEN 'DELHI'          THEN 1
                  WHEN 'BHOPAL'          THEN 2
                  WHEN 'KOTA'            THEN 3
                  WHEN 'AHMADABAD'       THEN 4
                  WHEN 'MP'              THEN 5
                  ELSE 100 END) ASC, ADDRESS DESC;
```

This would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
2	Khilan	25	Delhi	1500.00
5	Hardik	27	Bhopal	8500.00
3	kaushik	23	Kota	2000.00
6	Komal	22	MP	4500.00
4	Chaitali	25	Mumbai	6500.00
7	Muffy	24	Indore	10000.00
1	Ramesh	32	Ahmedabad	2000.00

```
+-----+-----+-----+-----+
```

This will sort customers by ADDRESS in your own order of preference first and in a natural order for the remaining addresses. Also remaining Addresses will be sorted in the reverse alpha order.

SQL - TOP, LIMIT or ROWNUM Clause

The SQL **TOP** clause is used to fetch a TOP N number or X percent records from a table.

Note: All the databases do not support TOP clause. For example MySQL supports **LIMIT** clause to fetch limited number of records and Oracle uses **ROWNUM** to fetch limited number of records.

Syntax:

The basic syntax of TOP clause with SELECT statement would be as follows:

```
SELECT TOP number|percent column_name(s)
FROM table_name
WHERE [condition]
```

Example:

Consider CUSTOMERS table is having following records:

```
+-----+-----+-----+-----+
| ID | NAME      | AGE   | ADDRESS     | SALARY  |
+-----+-----+-----+-----+
| 1  | Ramesh    | 32    | Ahmedabad   | 2000.00 |
| 2  | Khilan    | 25    | Delhi        | 1500.00 |
| 3  | kaushik   | 23    | Kota         | 2000.00 |
| 4  | Chaitali  | 25    | Mumbai       | 6500.00 |
| 5  | Hardik    | 27    | Bhopal      | 8500.00 |
| 6  | Komal     | 22    | MP          | 4500.00 |
```

```
| 7 | Muffy      | 24 | Indore      | 10000.00 |
+---+-----+-----+-----+
```

Following is an example on SQL server which would fetch top 3 records from CUSTOMERS table:

```
SQL> SELECT TOP 3 * FROM CUSTOMERS;
```

This would produce following result:

```
+----+----+----+----+----+
| ID | NAME      | AGE | ADDRESS     | SALARY   |
+----+----+----+----+----+
| 1  | Ramesh    | 32 | Ahmedabad   | 2000.00 |
| 2  | Khilan    | 25 | Delhi        | 1500.00 |
| 3  | kaushik   | 23 | Kota         | 2000.00 |
+----+----+----+----+----+
```

If you are using MySQL server then, here is equivalent example:

```
SQL> SELECT * FROM CUSTOMERS
LIMIT 3;
```

This would produce following result:

```
+----+----+----+----+----+
| ID | NAME      | AGE | ADDRESS     | SALARY   |
+----+----+----+----+----+
| 1  | Ramesh    | 32 | Ahmedabad   | 2000.00 |
| 2  | Khilan    | 25 | Delhi        | 1500.00 |
| 3  | kaushik   | 23 | Kota         | 2000.00 |
+----+----+----+----+----+
```

If you are using Oracle server then, here is equivalent example:

```
SQL> SELECT * FROM CUSTOMERS
WHERE ROWNUM <= 3;
```

This would produce following result:

```
+----+----+----+----+----+
| ID | NAME      | AGE | ADDRESS     | SALARY   |
+----+----+----+----+----+
| 1  | Ramesh    | 32 | Ahmedabad   | 2000.00 |
| 2  | Khilan    | 25 | Delhi        | 1500.00 |
| 3  | kaushik   | 23 | Kota         | 2000.00 |
+----+----+----+----+----+
```

SQL - DELETE Query

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is an example which would DELETE a customer whose ID is 6:

```
SQL> DELETE FROM CUSTOMERS  
WHERE ID = 6;
```

Now CUSTOMERS table would have following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
7	Muffy	24	Indore	10000.00

If you want to DELETE all the records from CUSTOMERS table, you do not need to use WHERE clause and DELETE query would be as follows:

```
SQL> DELETE FROM CUSTOMERS;
```

SQL - UPDATE Query

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is an example which would update ADDRESS for a customer whose ID is 6:

```
SQL> UPDATE CUSTOMERS  
SET ADDRESS = 'Pune'  
WHERE ID = 6;
```

Now CUSTOMERS table would have following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	Pune	4500.00
7	Muffy	24	Indore	10000.00

If you want to modify all ADDRESS and SALARY column values in CUSTOMERS table, you do not need to use WHERE clause and UPDATE query would be as follows:

```
SQL> UPDATE CUSTOMERS  
SET ADDRESS = 'Pune', SALARY = 1000.00;
```

Now CUSTOMERS table would have following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Pune	1000.00
2	Khilan	25	Pune	1000.00
3	kaushik	23	Pune	1000.00
4	Chaitali	25	Pune	1000.00
5	Hardik	27	Pune	1000.00
6	Komal	22	Pune	1000.00
7	Muffy	24	Pune	1000.00

SQL - AND and OR Conjunctive Operators

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is an example which would fetch ID, Name and Salary fields from the CUSTOMERS table where salary is greater than 2000 AND age is less tan 25 years:

```
SQL> SELECT ID, NAME, SALARY  
FROM CUSTOMERS  
WHERE SALARY > 2000 AND age < 25;
```

This would produce following result:

ID	NAME	SALARY
6	Komal	4500.00
7	Muffy	10000.00

The OR Operator:

The OR operator is used to combine multiple conditions in an SQL statement's WHERE clause.

Syntax:

The basic syntax of OR operator with WHERE clause is as follows:

```
SELECT column1, column2, columnN  
FROM table_name  
WHERE [condition1] OR [condition2]...OR [conditionN]
```

You can combine N number of conditions using OR operator. For an action to be taken by the SQL statement, whether it be a transaction or query, only any ONE of the conditions separated by the OR must be TRUE.

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is an example which would fetch ID, Name and Salary fields from the CUSTOMERS table where salary is greater than 2000 OR age is less tan 25 years:

```
SQL> SELECT ID, NAME, SALARY  
FROM CUSTOMERS  
WHERE SALARY > 2000 OR age < 25;
```

This would produce following result:

ID	NAME	SALARY
3	kaushik	2000.00
4	Chaitali	6500.00
5	Hardik	8500.00
6	Komal	4500.00
7	Muffy	10000.00

SQL - Using Joins

The **SQL Joins** clause is used to combine records from two or more tables in a database. A JOIN is a means for combining fields from two tables by using values common to each.

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT
102	2009-10-08 00:00:00	3	3000
100	2009-10-08 00:00:00	3	1500
101	2009-11-20 00:00:00	2	1560
103	2008-05-20 00:00:00	4	2060

Now let us join these two tables in our SELECT statement as follows:

```
SQL> SELECT ID, NAME, AGE, AMOUNT
      FROM CUSTOMERS, ORDERS
     WHERE CUSTOMERS.ID = ORDERS.CUSTOMER_ID;
```

This would produce following result:

ID	NAME	AGE	AMOUNT
3	kaushik	23	3000
3	kaushik	23	1500
2	Khilan	25	1560
4	Chaitali	25	2060

Here it is notable that the join is performed in the WHERE clause. Several operators can be used to join tables, such as =, <, >, <>, <=, >=, !=, BETWEEN, LIKE, and NOT; they can all be used to join tables. However, the most common operator is the equal symbol.

SQL Join Types:

There are different type of joins available in SQL:

- **INNER JOIN**: returns rows when there is a match in both tables.
- **LEFT JOIN**: returns all rows from the left table, even if there are no matches in the right table.

- RIGHT JOIN: returns all rows from the right table, even if there are no matches in the left table.
- FULL JOIN: returns rows when there is a match in one of the tables.
- SELF JOIN: is used to join a table to itself, as if the table were two tables, temporarily renaming at least one table in the SQL statement.
- CARTESIAN JOIN: returns the cartesian product of the sets of records from the two or more joined tables.

INNER JOIN

Syntax:

The basic syntax of **INNER JOIN** is as follows:

```
SELECT table1.column1, table2.column2...
FROM table1
INNER JOIN table2
ON table1.common_field = table2.common_field;
```

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

(b) Another table is ORDERS as follows:

OID	DATE	ID	AMOUNT
102	2009-10-08 00:00:00	3	3000
100	2009-10-08 00:00:00	3	1500
101	2009-11-20 00:00:00	2	1560
103	2008-05-20 00:00:00	4	2060

Now let us join these two tables using INNER JOIN as follows:

```
SQL> SELECT ID, NAME, AMOUNT, DATE
```

```

FROM CUSTOMERS
INNER JOIN ORDERS
ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID;

```

This would produce following result:

ID	NAME	AMOUNT	DATE
3	kaushik	3000	2009-10-08 00:00:00
3	kaushik	1500	2009-10-08 00:00:00
2	Khilan	1560	2009-11-20 00:00:00
4	Chaitali	2060	2008-05-20 00:00:00

LEFT JOIN

Syntax:

The basic syntax of **LEFT JOIN** is as follows:

```

SELECT table1.column1, table2.column2...
FROM table1
LEFT JOIN table2
ON table1.common_field = table2.common_field;

```

Here given condition could be any given expression based on your requirement.

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT

102 2009-10-08 00:00:00		3 3000
100 2009-10-08 00:00:00		3 1500
101 2009-11-20 00:00:00		2 1560
103 2008-05-20 00:00:00		4 2060

Now let us join these two tables using LEFT JOIN as follows:

```
SQL> SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      LEFT JOIN ORDERS
      ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID;
```

This would produce following result:

ID	NAME	AMOUNT	DATE
1	Ramesh	NULL	NULL
2	Khilan	1560	2009-11-20 00:00:00
3	kaushik	3000	2009-10-08 00:00:00
3	kaushik	1500	2009-10-08 00:00:00
4	Chaitali	2060	2008-05-20 00:00:00
5	Hardik	NULL	NULL
6	Komal	NULL	NULL
7	Muffy	NULL	NULL

RIGHT JOIN

Syntax:

The basic syntax of **RIGHT JOIN** is as follows:

```
SELECT table1.column1, table2.column2...
FROM table1
RIGHT JOIN table2
ON table1.common_field = table2.common_field;
```

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00

	4	Chaitali		25	Mumbai		6500.00	
	5	Hardik		27	Bhopal		8500.00	
	6	Komal		22	MP		4500.00	
	7	Muffy		24	Indore		10000.00	
+-----+-----+-----+-----+-----+								

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT	
102	2009-10-08 00:00:00	3	3000	
100	2009-10-08 00:00:00	3	1500	
101	2009-11-20 00:00:00	2	1560	
103	2008-05-20 00:00:00	4	2060	
+-----+-----+-----+-----+-----+				

Now let us join these two tables using RIGHT JOIN as follows:

```
SQL> SELECT ID, NAME, AMOUNT, DATE
   FROM CUSTOMERS
   RIGHT JOIN ORDERS
   ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID;
```

This would produce following result:

ID	NAME	AMOUNT	DATE	
3	kaushik	3000	2009-10-08 00:00:00	
3	kaushik	1500	2009-10-08 00:00:00	
2	Khilan	1560	2009-11-20 00:00:00	
4	Chaitali	2060	2008-05-20 00:00:00	
+-----+-----+-----+-----+-----+				

SQL - FULL JOINS

The SQL **FULL JOIN** combines the results of both left and right outer joins.

The joined table will contain all records from both tables, and fill in NULLs for missing matches on either side.

Syntax:

The basic syntax of **FULL JOIN** is as follows:

```
SELECT table1.column1, table2.column2...
  FROM table1
```

```

FULL JOIN table2
ON table1.common_field = table2.common_field;

```

Here given condition could be any given expression based on your requirement.

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT
102	2009-10-08 00:00:00	3	3000
100	2009-10-08 00:00:00	3	1500
101	2009-11-20 00:00:00	2	1560
103	2008-05-20 00:00:00	4	2060

Now let us join these two tables using FULL JOIN as follows:

```

SQL> SELECT ID, NAME, AMOUNT, DATE
  FROM CUSTOMERS
  FULL JOIN ORDERS
  ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID;

```

This would produce following result:

ID	NAME	AMOUNT	DATE
1	Ramesh	NULL	NULL
2	Khilan	1560	2009-11-20 00:00:00
3	kaushik	3000	2009-10-08 00:00:00
3	kaushik	1500	2009-10-08 00:00:00
4	Chaitali	2060	2008-05-20 00:00:00
5	Hardik	NULL	NULL
6	Komal	NULL	NULL
7	Muffy	NULL	NULL

```

|   3 | kaushik   |    3000 | 2009-10-08 00:00:00 |
|   3 | kaushik   |    1500 | 2009-10-08 00:00:00 |
|   2 | Khilan    |    1560 | 2009-11-20 00:00:00 |
|   4 | Chaitali   |    2060 | 2008-05-20 00:00:00 |
+-----+-----+-----+

```

If your Database does not support FULL JOIN like MySQL does not support FULL JOIN, then you can use **UNION ALL** clause to combine two JOINS as follows:

```

SQL> SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      LEFT JOIN ORDERS
        ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID
UNION ALL
      SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      RIGHT JOIN ORDERS
        ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID

```

SELF JOIN

The SQL **SELF JOIN** is used to join a table to itself, as if the table were two tables, temporarily renaming at least one table in the SQL statement.

Syntax:

The basic syntax of **SELF JOIN** is as follows:

```

SELECT a.column_name, b.column_name...
FROM table1 a, table1 b
WHERE a.common_field = b.common_field;

```

Here WHERE clause could be any given expression based on your requirement.

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

```

+-----+-----+-----+-----+
| ID | NAME      | AGE | ADDRESS     | SALARY |
+-----+-----+-----+-----+
|  1 | Ramesh    |  32 | Ahmedabad  | 2000.00 |
|  2 | Khilan    |  25 | Delhi       | 1500.00 |
|  3 | kaushik   |  23 | Kota        | 2000.00 |
|  4 | Chaitali   |  25 | Mumbai      | 6500.00 |
|  5 | Hardik    |  27 | Bhopal      | 8500.00 |

```

	6		Komal		22		MP		4500.00	
	7		Muffy		24		Indore		10000.00	
+	-----+	-----+	-----+	-----+	-----+	-----+	-----+	-----+	-----+	-----+

Now let us join this table using SELF JOIN as follows:

```
SQL> SELECT a.ID, b.NAME, a.SALARY
   FROM CUSTOMERS a, CUSTOMERS b
  WHERE a.SALARY < b.SALARY;
```

This would produce following result:

+-----+ ID NAME SALARY +-----+
2 Ramesh 1500.00
2 kaushik 1500.00
1 Chaitali 2000.00
2 Chaitali 1500.00
3 Chaitali 2000.00
6 Chaitali 4500.00
1 Hardik 2000.00
2 Hardik 1500.00
3 Hardik 2000.00
4 Hardik 6500.00
6 Hardik 4500.00
1 Komal 2000.00
2 Komal 1500.00
3 Komal 2000.00
1 Muffy 2000.00
2 Muffy 1500.00
3 Muffy 2000.00
4 Muffy 6500.00
5 Muffy 8500.00
6 Muffy 4500.00
-----+ +-----+

CARTESIAN JOIN or CROSS JOIN

The **CARTESIAN JOIN** or **CROSS JOIN** returns the cartesian product of the sets of records from the two or more joined tables. Thus, it equates to an inner join where the join-condition always evaluates to True or where the join-condition is absent from the statement.

Syntax:

The basic syntax of **INNER JOIN** is as follows:

```
SELECT table1.column1, table2.column2...
  FROM table1, table2 [, table3 ]
```

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT
102	2009-10-08 00:00:00	3	3000
100	2009-10-08 00:00:00	3	1500
101	2009-11-20 00:00:00	2	1560
103	2008-05-20 00:00:00	4	2060

Now let us join these two tables using INNER JOIN as follows:

```
SQL> SELECT ID, NAME, AMOUNT, DATE  
      FROM CUSTOMERS, ORDERS;
```

This would produce following result:

ID	NAME	AMOUNT	DATE
1	Ramesh	3000	2009-10-08 00:00:00
1	Ramesh	1500	2009-10-08 00:00:00
1	Ramesh	1560	2009-11-20 00:00:00
1	Ramesh	2060	2008-05-20 00:00:00
2	Khilan	3000	2009-10-08 00:00:00
2	Khilan	1500	2009-10-08 00:00:00
2	Khilan	1560	2009-11-20 00:00:00
2	Khilan	2060	2008-05-20 00:00:00
3	kaushik	3000	2009-10-08 00:00:00
3	kaushik	1500	2009-10-08 00:00:00
3	kaushik	1560	2009-11-20 00:00:00
3	kaushik	2060	2008-05-20 00:00:00
4	Chaitali	3000	2009-10-08 00:00:00
4	Chaitali	1500	2009-10-08 00:00:00
4	Chaitali	1560	2009-11-20 00:00:00
4	Chaitali	2060	2008-05-20 00:00:00

	5	Hardik	3000	2009-10-08 00:00:00	
	5	Hardik	1500	2009-10-08 00:00:00	
	5	Hardik	1560	2009-11-20 00:00:00	
	5	Hardik	2060	2008-05-20 00:00:00	
	6	Komal	3000	2009-10-08 00:00:00	
	6	Komal	1500	2009-10-08 00:00:00	
	6	Komal	1560	2009-11-20 00:00:00	
	6	Komal	2060	2008-05-20 00:00:00	
	7	Muffy	3000	2009-10-08 00:00:00	
	7	Muffy	1500	2009-10-08 00:00:00	
	7	Muffy	1560	2009-11-20 00:00:00	
	7	Muffy	2060	2008-05-20 00:00:00	
+-----+-----+-----+-----+					

SQL UNION

The SQL **UNION** clause/operator is used to combine the results of two or more SELECT statements without returning any duplicate rows.

To use UNION, each SELECT must have the same number of columns selected, the same number of column expressions, the same data type, and have them in the same order but they do not have to be the same length.

Syntax:

The basic syntax of **UNION** is as follows:

```
SELECT column1 [, column2 ]
FROM table1 [, table2 ]
[WHERE condition]

UNION
```

```
SELECT column1 [, column2 ]
FROM table1 [, table2 ]
[WHERE condition]
```

Here given condition could be any given expression based on your requirement.

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

+-----+-----+-----+-----+				
ID NAME	AGE	ADDRESS	SALARY	
+-----+-----+-----+-----+				
1 Ramesh	32	Ahmedabad	2000.00	

	2		Khilan		25		Delhi		1500.00	
	3		kaushik		23		Kota		2000.00	
	4		Chaitali		25		Mumbai		6500.00	
	5		Hardik		27		Bhopal		8500.00	
	6		Komal		22		MP		4500.00	
	7		Muffy		24		Indore		10000.00	

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT	
102	2009-10-08 00:00:00	3	3000	
100	2009-10-08 00:00:00	3	1500	
101	2009-11-20 00:00:00	2	1560	
103	2008-05-20 00:00:00	4	2060	

Now let us join these two tables in our SELECT statement as follows:

```
SQL> SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      LEFT JOIN ORDERS
        ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID
UNION
      SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      RIGHT JOIN ORDERS
        ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID;
```

This would produce following result:

ID	NAME	AMOUNT	DATE	
1	Ramesh	NULL	NULL	
2	Khilan	1560	2009-11-20 00:00:00	
3	kaushik	3000	2009-10-08 00:00:00	
3	kaushik	1500	2009-10-08 00:00:00	
4	Chaitali	2060	2008-05-20 00:00:00	
5	Hardik	NULL	NULL	
6	Komal	NULL	NULL	
7	Muffy	NULL	NULL	

The UNION ALL Clause:

The UNION ALL operator is used to combine the results of two SELECT statements including duplicate rows.

The same rules that apply to UNION apply to the UNION ALL operator.

Syntax:

The basic syntax of **UNION ALL** is as follows:

```
SELECT column1 [, column2 ]
FROM table1 [, table2 ]
[WHERE condition]
```

UNION ALL

```
SELECT column1 [, column2 ]
FROM table1 [, table2 ]
[WHERE condition]
```

Here given condition could be any given expression based on your requirement.

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT
102	2009-10-08 00:00:00	3	3000
100	2009-10-08 00:00:00	3	1500
101	2009-11-20 00:00:00	2	1560
103	2008-05-20 00:00:00	4	2060

Now let us join these two tables in our SELECT statement as follows:

```
SQL> SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      LEFT JOIN ORDERS
        ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID
UNION ALL
      SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
```

```
RIGHT JOIN ORDERS  
ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID;
```

This would produce following result:

ID	NAME	AMOUNT	DATE
1	Ramesh	NULL	NULL
2	Khilan	1560	2009-11-20 00:00:00
3	kaushik	3000	2009-10-08 00:00:00
3	kaushik	1500	2009-10-08 00:00:00
4	Chaitali	2060	2008-05-20 00:00:00
5	Hardik	NULL	NULL
6	Komal	NULL	NULL
7	Muffy	NULL	NULL
3	kaushik	3000	2009-10-08 00:00:00
3	kaushik	1500	2009-10-08 00:00:00
2	Khilan	1560	2009-11-20 00:00:00
4	Chaitali	2060	2008-05-20 00:00:00

There are two other clauses (i.e operators) which are very similar to UNION clause:

- **SQL INTERSECT Clause:** is used to combine two SELECT statements, but returns rows only from the first SELECT statement that are identical to a row in the second SELECT statement.
- **SQL EXCEPT Clause :** combines two SELECT statements and returns rows from the first SELECT statement that are not returned by the second SELECT statement.

INTERSECT clause/operator

The SQL **INTERSECT** clause/operator is used to combine two SELECT statements, but returns rows only from the first SELECT statement that are identical to a row in the second SELECT statement. This means INTERSECT returns only common rows returned by the two SELECT statements.

Just as with the UNION operator, the same rules apply when using the INTERSECT operator. MySQL does not support INTERSECT operator

Syntax:

The basic syntax of **INTERSECT** is as follows:

```
SELECT column1 [, column2 ]  
FROM table1 [, table2 ]  
[WHERE condition]
```

```
INTERSECT
```

```

SELECT column1 [, column2 ]
FROM table1 [, table2 ]
[WHERE condition]

```

Here given condition could be any given expression based on your requirement.

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT
102	2009-10-08 00:00:00	3	3000
100	2009-10-08 00:00:00	3	1500
101	2009-11-20 00:00:00	2	1560
103	2008-05-20 00:00:00	4	2060

Now let us join these two tables in our SELECT statement as follows:

```

SQL> SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      LEFT JOIN ORDERS
        ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID
INTERSECT
      SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      RIGHT JOIN ORDERS
        ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID;

```

This would produce following result:

ID	NAME	AMOUNT	DATE
3	kaushik	3000	2009-10-08 00:00:00
3	kaushik	1500	2009-10-08 00:00:00

```

| 2 | Ramesh | 1560 | 2009-11-20 00:00:00 |
| 4 | kaushik | 2060 | 2008-05-20 00:00:00 |
+---+-----+-----+-----+

```

SQL - EXCEPT Clause

The SQL **EXCEPT** clause/operator is used to combine two SELECT statements and returns rows from the first SELECT statement that are not returned by the second SELECT statement. This means EXCEPT returns only rows which are not available in second SELECT statement.

Just as with the UNION operator, the same rules apply when using the EXCEPT operator. MySQL does not support EXCEPT operator.

Syntax:

The basic syntax of **EXCEPT** is as follows:

```

SELECT column1 [, column2 ]
FROM table1 [, table2 ]
[WHERE condition]

EXCEPT

SELECT column1 [, column2 ]
FROM table1 [, table2 ]
[WHERE condition]

```

Here given condition could be any given expression based on your requirement.

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

```

+---+-----+---+-----+-----+
| ID | NAME      | AGE | ADDRESS     | SALARY   |
+---+-----+---+-----+-----+
| 1  | Ramesh    | 32 | Ahmedabad  | 2000.00 |
| 2  | Khilan    | 25 | Delhi       | 1500.00 |
| 3  | kaushik   | 23 | Kota        | 2000.00 |
| 4  | Chaitali  | 25 | Mumbai      | 6500.00 |
| 5  | Hardik    | 27 | Bhopal     | 8500.00 |
| 6  | Komal     | 22 | MP          | 4500.00 |
| 7  | Muffy     | 24 | Indore     | 10000.00|
+---+-----+---+-----+-----+

```

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT
102	2009-10-08 00:00:00	3	3000
100	2009-10-08 00:00:00	3	1500
101	2009-11-20 00:00:00	2	1560
103	2008-05-20 00:00:00	4	2060

Now let us join these two tables in our SELECT statement as follows:

```
SQL> SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      LEFT JOIN ORDERS
      ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID
EXCEPT
      SELECT ID, NAME, AMOUNT, DATE
      FROM CUSTOMERS
      RIGHT JOIN ORDERS
      ON CUSTOMERS.ID = ORDERS.CUSTOMER_ID;
```

This would produce following result:

ID	NAME	AMOUNT	DATE
1	Ramesh	NULL	NULL
5	Hardik	NULL	NULL
6	Komal	NULL	NULL
7	Muffy	NULL	NULL

SQL - NULL Values

The SQL **NULL** is the term used to represent a missing value. A NULL value in a table is a value in a field that appears to be blank.

A field with a NULL value is a field with no value. It is very important to understand that a NULL value is different than a zero value or a field that contains spaces.

Syntax:

The basic syntax of **NULL** while creating a table:

```

SQL> CREATE TABLE CUSTOMERS (
    ID      INT          NOT NULL,
    NAME   VARCHAR (20)  NOT NULL,
    AGE    INT          NOT NULL,
    ADDRESS CHAR (25),
    SALARY  DECIMAL (18, 2),
    PRIMARY KEY (ID)
);

```

Here **NOT NULL** signifies that column should always accept an explicit value of the given data type. There are two columns where we did not use NOT NULL which means these columns could be NULL.

A field with a NULL value is one that has been left blank during record creation.

Example:

The NULL value can cause problems when selecting data, however, because when comparing an unknown value to any other value, the result is always unknown and not included in the final results.

You must use the **IS NULL** or **IS NOT NULL** operators in order to check for a NULL value.

Consider following table, CUSTOMERS having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	
7	Muffy	24	Indore	

Now following is the usage of **IS NOT NULL** operator:

```

SQL> SELECT ID, NAME, AGE, ADDRESS, SALARY
  FROM CUSTOMERS
 WHERE SALARY IS NOT NULL;

```

This would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00

```

| 4 | Chaitali | 25 | Mumbai      | 6500.00 |
| 5 | Hardik   | 27 | Bhopal     | 8500.00 |
+---+-----+-----+-----+

```

Now following is the usage of **IS NULL** operator:

```

SQL> SELECT ID, NAME, AGE, ADDRESS, SALARY
  FROM CUSTOMERS
 WHERE SALARY IS NULL;

```

This would produce following result:

```

+---+-----+-----+-----+-----+
| ID | NAME      | AGE | ADDRESS    | SALARY |
+---+-----+-----+-----+-----+
| 6  | Komal     | 22  | MP          |        |
| 7  | Muffy     | 24  | Indore     |        |
+---+-----+-----+-----+-----+

```

SQL - Alias Syntax

You can rename a table or a column temporarily by giving another name known as alias.

The use of table aliases means to rename a table in a particular SQL statement. The renaming is a temporary change and the actual table name does not change in the database.

The column aliases are used to rename a table's columns for the purpose of a particular SQL query.

Syntax:

The basic syntax of **table** alias is as follows:

```

SELECT column1, column2....
FROM table_name AS alias_name
WHERE [condition];

```

The basic syntax of **column** alias is as follows:

```

SELECT column_name AS alias_name
FROM table_name
WHERE [condition];

```

Example:

Consider following two tables, (a) CUSTOMERS table is as follows:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

(b) Another table is ORDERS as follows:

OID	DATE	CUSTOMER_ID	AMOUNT
102	2009-10-08 00:00:00	3	3000
100	2009-10-08 00:00:00	3	1500
101	2009-11-20 00:00:00	2	1560
103	2008-05-20 00:00:00	4	2060

Now following is the usage of **table alias**:

```
SQL> SELECT C.ID, C.NAME, C.AGE, O.AMOUNT
      FROM CUSTOMERS AS C, ORDERS AS O
     WHERE C.ID = O.CUSTOMER_ID;
```

This would produce following result:

ID	NAME	AGE	AMOUNT
3	kaushik	23	3000
3	kaushik	23	1500
2	Khilan	25	1560
4	Chaitali	25	2060

Following is the usage of **column alias**:

```
SQL> SELECT ID AS CUSTOMER_ID, NAME AS CUSTOMER_NAME
      FROM CUSTOMERS
     WHERE SALARY IS NOT NULL;
```

This would produce following result:

CUSTOMER_ID	CUSTOMER_NAME

1	Ramesh
2	Khilan
3	kaushik
4	Chaitali
5	Hardik
6	Komal
7	Muffy

SQL - Indexes

Indexes are special lookup tables that the database search engine can use to speed up data retrieval. Simply put, an index is a pointer to data in a table. An index in a database is very similar to an index in the back of a book.

For example, if you want to reference all pages in a book that discuss a certain topic, you first refer to the index, which lists all topics alphabetically, and are then referred to one or more specific page numbers.

An index helps speed up SELECT queries and WHERE clauses, but it slows down data input, with UPDATE and INSERT statements. Indexes can be created or dropped with no effect on the data.

Creating an index involves the CREATE INDEX statement, which allows you to name the index, to specify the table and which column or columns to index, and to indicate whether the index is in ascending or descending order.

Indexes can also be unique, similar to the UNIQUE constraint, in that the index prevents duplicate entries in the column or combination of columns on which there's an index.

The CREATE INDEX Command:

The basic syntax of **CREATE INDEX** is as follows:

```
CREATE INDEX index_name ON table_name;
```

Single-Column Indexes:

A single-column index is one that is created based on only one table column. The basic syntax is as follows:

```
CREATE INDEX index_name
ON table_name (column_name);
```

Unique Indexes:

Unique indexes are used not only for performance, but also for data integrity. A unique index does not allow any duplicate values to be inserted into the table. The basic syntax is as follows:

```
CREATE INDEX index_name  
on table_name (column_name);
```

Composite Indexes:

A composite index is an index on two or more columns of a table. The basic syntax is as follows:

```
CREATE INDEX index_name  
on table_name (column1, column2);
```

Whether to create a single-column index or a composite index, take into consideration the column(s) that you may use very frequently in a query's WHERE clause as filter conditions.

Should there be only one column used, a single-column index should be the choice. Should there be two or more columns that are frequently used in the WHERE clause as filters, the composite index would be the best choice.

Implicit Indexes:

Implicit indexes are indexes that are automatically created by the database server when an object is created. Indexes are automatically created for primary key constraints and unique constraints.

The DROP INDEX Command:

An index can be dropped using SQL **DROP** command. Care should be taken when dropping an index because performance may be slowed or improved.

The basic syntax is as follows:

```
DROP INDEX index_name;
```

You can check [INDEX Constraint](#) chapter to see actual examples on Indexes.

When should indexes be avoided?

Although indexes are intended to enhance a database's performance, there are times when they should be avoided. The following guidelines indicate when the use of an index should be reconsidered:

- Indexes should not be used on small tables.

- Tables that have frequent, large batch update or insert operations.
- Indexes should not be used on columns that contain a high number of NULL values.
- Columns that are frequently manipulated should not be indexed.

SQL - ALTER TABLE Command

The SQL **ALTER TABLE** command is used to add, delete, or modify columns in an existing table.

You would also use ALTER TABLE command to add and drop various constraints on a an existing table.

Syntax:

The basic syntax of **ALTER TABLE** to add a new column in an existing table is as follows:

```
ALTER TABLE table_name ADD column_name datatype;
```

The basic syntax of ALTER TABLE to **DROP COLUMN** in an existing table is as follows:

```
ALTER TABLE table_name DROP COLUMN column_name;
```

The basic syntax of ALTER TABLE to change the **DATA TYPE** of a column in a table is as follows:

```
ALTER TABLE table_name MODIFY COLUMN column_name datatype;
```

The basic syntax of ALTER TABLE to add a **NOT NULL** constraint to a column in a table is as follows:

```
ALTER TABLE table_name MODIFY column_name datatype NOT NULL;
```

The basic syntax of ALTER TABLE to **ADD UNIQUE CONSTRAINT** to a table is as follows:

```
ALTER TABLE table_name
ADD CONSTRAINT MyUniqueConstraint UNIQUE(column1, column2...);
```

The basic syntax of ALTER TABLE to **ADD CHECK CONSTRAINT** to a table is as follows:

```
ALTER TABLE table_name
ADD CONSTRAINT MyUniqueConstraint CHECK (CONDITION);
```

The basic syntax of ALTER TABLE to **ADD PRIMARY KEY** constraint to a table is as follows:

```
ALTER TABLE table_name  
ADD CONSTRAINT MyPrimaryKey PRIMARY KEY (column1, column2...);
```

The basic syntax of ALTER TABLE to **DROP CONSTRAINT** from a table is as follows:

```
ALTER TABLE table_name  
DROP CONSTRAINT MyUniqueConstraint;
```

If you're using MySQL, the code is as follows:

```
ALTER TABLE table_name  
DROP INDEX MyUniqueConstraint;
```

The basic syntax of ALTER TABLE to **DROP PRIMARY KEY** constraint from a table is as follows:

```
ALTER TABLE table_name  
DROP CONSTRAINT MyPrimaryKey;
```

If you're using MySQL, the code is as follows:

```
ALTER TABLE table_name  
DROP PRIMARY KEY;
```

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is the example to ADD a new column in an existing table:

```
ALTER TABLE CUSTOMERS ADD SEX char(1);
```

Now CUSTOMERS table is changed and following would be output from SELECT statement:

```
+-----+-----+-----+-----+
```

ID	NAME	AGE	ADDRESS	SALARY	SEX
1	Ramesh	32	Ahmedabad	2000.00	NULL
2	Ramesh	25	Delhi	1500.00	NULL
3	kaushik	23	Kota	2000.00	NULL
4	kaushik	25	Mumbai	6500.00	NULL
5	Hardik	27	Bhopal	8500.00	NULL
6	Komal	22	MP	4500.00	NULL
7	Muffy	24	Indore	10000.00	NULL

Following is the example to DROP sex column from existing table:

```
ALTER TABLE CUSTOMERS DROP SEX;
```

Now CUSTOMERS table is changed and following would be output from SELECT statement:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Ramesh	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	kaushik	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

SQL - TRUNCATE TABLE Command

The SQL **TRUNCATE TABLE** command is used to delete complete data from an existing table.

You can also use **DROP TABLE** command to delete complete table but it would remove complete table structure form the database and you would need to re-create this table once again if you wish you store some data.

Syntax:

The basic syntax of **TRUNCATE TABLE** is as follows:

```
TRUNCATE TABLE table_name;
```

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is the example to truncate:

```
SQL > TRUNCATE TABLE CUSTOMERS;
```

Now CUSTOMERS table is truncated and following would be output from SELECT statement:

```
SQL> SELECT * FROM CUSTOMERS;
Empty set (0.00 sec)
```

SQL - Having Clause

The HAVING clause enables you to specify conditions that filter which group results appear in the final results.

The WHERE clause places conditions on the selected columns, whereas the HAVING clause places conditions on groups created by the GROUP BY clause.

Syntax:

The following is the position of the HAVING clause in a query:

```
SELECT
FROM
WHERE
GROUP BY
HAVING
ORDER BY
```

The HAVING clause must follow the GROUP BY clause in a query and must also precede the ORDER BY clause if used. The following is the syntax of the SELECT statement, including the HAVING clause:

```
SELECT column1, column2
FROM table1, table2
WHERE [ conditions ]
GROUP BY column1, column2
HAVING [ conditions ]
ORDER BY column1, column2
```

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is the example which would display record for which similar age count would be more than or equal to 2:

```
SQL > SELECT *
FROM CUSTOMERS
GROUP BY age
HAVING COUNT(age) >= 2;
```

This would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
2	Khilan	25	Delhi	1500.00

The COMMIT Command:

The COMMIT command is the transactional command used to save changes invoked by a transaction to the database.

The COMMIT command saves all transactions to the database since the last COMMIT or ROLLBACK command.

The syntax for COMMIT command is as follows:

```
COMMIT;
```

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is the example which would delete records from the table having age = 25, and then COMMIT the changes in the database.

```
SQL> DELETE FROM CUSTOMERS  
      WHERE AGE = 25;  
SQL> COMMIT;
```

As a result, two rows from the table would be deleted and SELECT statement would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
3	kaushik	23	Kota	2000.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

The ROLLBACK Command:

The ROLLBACK command is the transactional command used to undo transactions that have not already been saved to the database.

The ROLLBACK command can only be used to undo transactions since the last COMMIT or ROLLBACK command was issued.

The syntax for ROLLBACK command is as follows:

```
ROLLBACK;
```

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following is the example which would delete records from the table having age = 25, and then ROLLBACK the changes in the database.

```
SQL> DELETE FROM CUSTOMERS  
      WHERE AGE = 25;  
SQL> ROLLBACK;
```

As a result, delete operation would not impact the table and SELECT statement would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

The SAVEPOINT Command:

A SAVEPOINT is a point in a transaction when you can roll the transaction back to a certain point without rolling back the entire transaction.

The syntax for SAVEPOINT command is as follows:

```
SAVEPOINT SAVEPOINT_NAME;
```

This command serves only in the creation of a SAVEPOINT among transactional statements. The ROLLBACK command is used to undo a group of transactions.

The syntax for rolling back to a SAVEPOINT is as follows:

```
ROLLBACK TO SAVEPOINT_NAME;
```

Following is an example where you plan to delete the three different records from the CUSTOMERS table. You want to create a SAVEPOINT before each delete, so that you can ROLLBACK to any SAVEPOINT at any time to return the appropriate data to its original state:

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Now here is the series of operations:

```
SQL> SAVEPOINT SP1;
Savepoint created.
SQL> DELETE FROM CUSTOMERS WHERE ID=1;
1 row deleted.
SQL> SAVEPOINT SP2;
Savepoint created.
SQL> DELETE FROM CUSTOMERS WHERE ID=2;
1 row deleted.
SQL> SAVEPOINT SP3;
Savepoint created.
SQL> DELETE FROM CUSTOMERS WHERE ID=3;
1 row deleted.
```

Now that the three deletions have taken place, say you have changed your mind and decided to ROLLBACK to the SAVEPOINT that you identified as SP2. Because SP2 was created after the first deletion, the last two deletions are undone:

```
SQL> ROLLBACK TO SP2;
Rollback complete.
```

Notice that only the first deletion took place since you rolled back to SP2:

```

SQL> SELECT * FROM CUSTOMERS;
+----+-----+-----+-----+-----+
| ID | NAME      | AGE   | ADDRESS     | SALARY |
+----+-----+-----+-----+-----+
| 2  | Khilan    | 25    | Delhi        | 1500.00 |
| 3  | kaushik   | 23    | Kota         | 2000.00 |
| 4  | Chaitali  | 25    | Mumbai       | 6500.00 |
| 5  | Hardik    | 27    | Bhopal       | 8500.00 |
| 6  | Komal     | 22    | MP           | 4500.00 |
| 7  | Muffy     | 24    | Indore       | 10000.00 |
+----+-----+-----+-----+-----+
6 rows selected.

```

The RELEASE SAVEPOINT Command:

The RELEASE SAVEPOINT command is used to remove a SAVEPOINT that you have created.

The syntax for RELEASE SAVEPOINT is as follows:

```
RELEASE SAVEPOINT SAVEPOINT_NAME;
```

Once a SAVEPOINT has been released, you can no longer use the ROLLBACK command to undo transactions performed since the SAVEPOINT.

TRANSACTION

The SET TRANSACTION Command:

The SET TRANSACTION command can be used to initiate a database transaction. This command is used to specify characteristics for the transaction that follows.

For example, you can specify a transaction to be read only, or read write.

The syntax for SET TRANSACTION is as follows:

```
SET TRANSACTION [ READ WRITE | READ ONLY ];
```

Transaction Control:

There are following commands used to control transactions:

- **COMMIT:** to save the changes.
- **ROLLBACK:** to rollback the changes.
- **SAVEPOINT:** creates points within groups of transactions in which to ROLLBACK

- **SET TRANSACTION:** Places a name on a transaction.

Transactional control commands are only used with the DML commands INSERT, UPDATE, and DELETE only. They can not be used while creating tables or dropping them because these operations are automatically committed in the database.

SQL - Temporary Tables

There are RDBMS which support temporary tables. Temporary Tables are a great feature that lets you store and process intermediate results by using the same selection, update, and join capabilities that you can use with typical SQL Server tables.

The temporary tables could be very useful in some cases to keep temporary data. The most important thing that should be known for temporary tables is that they will be deleted when the current client session terminates.

Temporary tables are available in MySQL version 3.23 onwards. If you use an older version of MySQL than 3.23 you can't use temporary tables, but you can use heap tables.

As stated earlier temporary tables will only last as long as the session is alive. If you run the code in a PHP script, the temporary table will be destroyed automatically when the script finishes executing. If you are connected to the MySQL database server through the MySQL client program, then the temporary table will exist until you close the client or manually destroy the table.

Example

Here is an example showing you usage of temporary table:

```
mysql> CREATE TEMPORARY TABLE SALESSUMMARY (
    -> product_name VARCHAR(50) NOT NULL
    -> , total_sales DECIMAL(12,2) NOT NULL DEFAULT 0.00
    -> , avg_unit_price DECIMAL(7,2) NOT NULL DEFAULT 0.00
    -> , total_units_sold INT UNSIGNED NOT NULL DEFAULT 0
);
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO SALESSUMMARY
    -> (product_name, total_sales, avg_unit_price, total_units_sold)
    -> VALUES
    -> ('cucumber', 100.25, 90, 2);

mysql> SELECT * FROM SALESSUMMARY;
+-----+-----+-----+-----+
| product_name | total_sales | avg_unit_price | total_units_sold |
+-----+-----+-----+-----+
```

```
+-----+-----+-----+-----+
| cucumber |      100.25 |      90.00 |      2 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

When you issue a **SHOW TABLES** command then your temporary table would not be listed out in the list. Now if you will log out of the MySQL session and then you will issue a **SELECT** command then you will find no data available in the database. Even your temporary table would also not exist.

Dropping Temporary Tables:

By default all the temporary tables are deleted by MySQL when your database connection gets terminated. Still you want to delete them in between then you do so by issuing **DROP TABLE** command.

Following is the example on dropping a temporary table.

```
mysql
```

SQL - Clone Tables

There may be a situation when you need an exact copy of a table, and **CREATE TABLE ... SELECT...** doesn't suit your purposes because the copy must include the same indexes, default values, and so forth.

If you are using MySQL RDBMS, you can handle this situation by following steps.

- Use **SHOW CREATE TABLE** command to get a **CREATE TABLE** statement that specifies the source table's structure, indexes and all.
- Modify the statement to change the table name to that of the clone table and execute the statement. This way you will have exact clone table.
- Optionally, If you need the table contents copied as well, issue an **INSERT INTO ... SELECT** statement, too.

Example:

Try out following example to create a clone table for **TUTORIALS_TBL** whose structure is as follows:

Step 1:

Get complete structure about table

```

SQL> SHOW CREATE TABLE TUTORIALS_TBL \G;
***** 1. row ****
      Table: TUTORIALS_TBL
Create Table: CREATE TABLE `TUTORIALS_TBL` (
  `tutorial_id` int(11) NOT NULL auto_increment,
  `tutorial_title` varchar(100) NOT NULL default '',
  `tutorial_author` varchar(40) NOT NULL default '',
  `submission_date` date default NULL,
  PRIMARY KEY (`tutorial_id`),
  UNIQUE KEY `AUTHOR_INDEX` (`tutorial_author`)
) TYPE=MyISAM
1 row in set (0.00 sec)

```

Step 2:

Rename this table and create another table

```

SQL> CREATE TABLE `CLONE_TBL` (
    -> `tutorial_id` int(11) NOT NULL auto_increment,
    -> `tutorial_title` varchar(100) NOT NULL default '',
    -> `tutorial_author` varchar(40) NOT NULL default '',
    -> `submission_date` date default NULL,
    -> PRIMARY KEY (`tutorial_id`),
    -> UNIQUE KEY `AUTHOR_INDEX` (`tutorial_author`)
-> ) TYPE=MyISAM;
Query OK, 0 rows affected (1.80 sec)

```

Step 3:

After executing step 2 you will have a clone table in your database. If you want to copy data from old table then you can do it by using `INSERT INTO... SELECT` statement.

```

SQL> INSERT INTO CLONE_TBL (tutorial_id,
    ->                           tutorial_title,
    ->                           tutorial_author,
    ->                           submission_date)
    -> SELECT tutorial_id,tutorial_title,
    ->        tutorial_author,submission_date,
    -> FROM TUTORIALS_TBL;
Query OK, 3 rows affected (0.07 sec)
Records: 3  Duplicates: 0  Warnings: 0

```

Finally you will have exact clone table as you wanted to have.

SQL - Sub Queries

A Subquery or Inner query or Nested query is a query within another SQL query, and embedded within the WHERE clause.

A subquery is used to return data that will be used in the main query as a condition to further restrict the data to be retrieved.

Subqueries can be used with the SELECT, INSERT, UPDATE, and DELETE statements along with the operators like =, <, >, >=, <=, IN, BETWEEN etc.

There are a few rules that subqueries must follow:

- Subqueries must be enclosed within parentheses.
- A subquery can have only one column in the SELECT clause, unless multiple columns are in the main query for the subquery to compare its selected columns.
- An ORDER BY cannot be used in a subquery, although the main query can use an ORDER BY. The GROUP BY can be used to perform the same function as the ORDER BY in a subquery.
- Subqueries that return more than one row can only be used with multiple value operators, such as the IN operator.
- The SELECT list cannot include any references to values that evaluate to a BLOB, ARRAY, CLOB, or NCLOB.
- A subquery cannot be immediately enclosed in a set function.
- The BETWEEN operator cannot be used with a subquery; however, the BETWEEN can be used within the subquery.

Subqueries with the SELECT Statement:

Subqueries are most frequently used with the SELECT statement. The basic syntax is as follows:

```
SELECT column_name [, column_name ]
FROM   table1 [, table2 ]
WHERE  column_name OPERATOR
       (SELECT column_name [, column_name ]
        FROM table1 [, table2 ]
        [WHERE])
```

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	35	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Now let us check following sub-query with SELECT statement:

```
SQL> SELECT *
  FROM CUSTOMERS
 WHERE ID IN (SELECT ID
               FROM CUSTOMERS
              WHERE SALARY > 4500) ;
```

This would produce following result:

ID	NAME	AGE	ADDRESS	SALARY
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
7	Muffy	24	Indore	10000.00

Subqueries with the INSERT Statement:

Subqueries also can be used with INSERT statements. The INSERT statement uses the data returned from the subquery to insert into another table. The selected data in the subquery can be modified with any of the character, date, or number functions.

The basic syntax is as follows:

```
INSERT INTO table_name [ (column1 [, column2] ) ]
           SELECT [ *|column1 [, column2] ]
                  FROM table1 [, table2]
                  [ WHERE VALUE OPERATOR ]
```

Example:

Consider a table CUSTOMERS_BKP with similar structure as CUSTOMERS table. Now to copy complete CUSTOMERS table into CUSTOMERS_BKP, following is the syntax:

```
SQL> INSERT INTO CUSTOMERS_BKP
      SELECT * FROM CUSTOMERS
      WHERE ID IN (SELECT ID
                    FROM CUSTOMERS) ;
```

Subqueries with the UPDATE Statement:

The subquery can be used in conjunction with the UPDATE statement. Either single or multiple columns in a table can be updated when using a subquery with the UPDATE statement.

The basic syntax is as follows:

```
UPDATE table
```

```

SET column_name = new_value
[ WHERE OPERATOR [ VALUE ]
  (SELECT COLUMN_NAME
  FROM TABLE_NAME)
  [ WHERE) ]

```

Example:

Assuming, we have CUSTOMERS_BKP table available which is backup of CUSTOMERS table.

Following example updates SALARY by 0.25 times in CUSTOMERS table for all the customers whose AGE is greater than or equal to 27:

```

SQL> UPDATE CUSTOMERS
      SET SALARY = SALARY * 0.25
      WHERE AGE IN (SELECT AGE FROM CUSTOMERS_BKP
                     WHERE AGE >= 27 );

```

This would impact two rows and finally CUSTOMERS table would have following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	35	Ahmedabad	125.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	2125.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Subqueries with the DELETE Statement:

The subquery can be used in conjunction with the DELETE statement like with any other statements mentioned above.

The basic syntax is as follows:

```

DELETE FROM TABLE_NAME
[ WHERE OPERATOR [ VALUE ]
  (SELECT COLUMN_NAME
  FROM TABLE_NAME)
  [ WHERE) ]

```

Example:

Assuming, we have CUSTOMERS_BKP table available which is backup of CUSTOMERS table.

Following example deletes records from CUSTOMERS table for all the customers whose AGE is greater than or equal to 27:

```
SQL> DELETE FROM CUSTOMERS
      WHERE AGE IN (SELECT AGE FROM CUSTOMERS_BKP
                     WHERE AGE > 27 );
```

This would impact two rows and finally CUSTOMERS table would have following records:

ID	NAME	AGE	ADDRESS	SALARY
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

SQL - Handling Duplicates

There may be a situation when you have multiple duplicate records in a table. While fetching such records, it makes more sense to fetch only unique records instead of fetching duplicate records.

The SQL **DISTINCT** keyword, which we already have discussed, is used in conjunction with SELECT statement to eliminate all the duplicate records and fetching only unique records.

Syntax:

The basic syntax of DISTINCT keyword to eliminate duplicate records is as follows:

```
SELECT DISTINCT column1, column2, ....columnN
FROM table_name
WHERE [condition]
```

Example:

Consider CUSTOMERS table is having following records:

ID	NAME	AGE	ADDRESS	SALARY
1	Amit	25	Delhi	1500.00
2	Amit	25	Delhi	1500.00
3	Shivani	23	Kota	2000.00
4	Shivani	23	Kota	2000.00
5	Prashant	25	Mumbai	6500.00
6	Prashant	25	Mumbai	6500.00
7	Yashika	22	MP	4500.00
8	Yashika	22	MP	4500.00
9	Harshita	24	Indore	10000.00
10	Harshita	24	Indore	10000.00

1	Ramesh	32	Ahmedabad	2000.00	
2	Khilan	25	Delhi	1500.00	
3	kaushik	23	Kota	2000.00	
4	Chaitali	25	Mumbai	6500.00	
5	Hardik	27	Bhopal	8500.00	
6	Komal	22	MP	4500.00	
7	Muffy	24	Indore	10000.00	

First let us see how the following SELECT query returns duplicate salary records:

```
SQL> SELECT SALARY FROM CUSTOMERS
      ORDER BY SALARY;
```

This would produce following result where salary 2000 is coming twice which is a duplicate record from the original table.

SALARY
1500.00
2000.00
2000.00
4500.00
6500.00
8500.00
10000.00

Now let us use DISTINCT keyword with the above SELECT query and see the result:

```
SQL> SELECT DISTINCT SALARY FROM CUSTOMERS
      ORDER BY SALARY;
```

This would produce following result where we do not have any duplicate entry:

SALARY
1500.00
2000.00
4500.00
6500.00
8500.00
10000.00
